ENDOMETRİOZİSE BAĞLI PELVİK VE İNTRAABDOMİNAL SİNİR İNVAZYONU

Erkan ELÇİ¹⁹

GİRİŞ

Endometriozis, üreme çağındaki kadınlarda görülen östrojen bağımlı bir enfiamatuar hastalık ve menopozda inaktif hale gelir (1). Endometriozis üreme çağındaki kadınların %6-10'unda (2), jinekolojik sebeple opere edilen hastaların %1'inde, sterilizasyon uygulanan hastaların %6-40'unda, infertilite ya da pelvik ağrı nedeniyle laparoskopisi yapılan hastaların %20-50 'inde görülmektedir (1,3).

Endometriozis (EM) bulunduğu yere göre dört gruba ayrılmıştır. (4); a). Peritoneal endometriozis, b). Kistik endometriozis (endometrioma), c). Derin infiltran endometriozis (DIE), d). Ekstra-pelvik endometriozis. Bu farklı endometriozis tiplerinin orijininin de farklı olduğu ileri sürülmüştür (3). Ancak endometriozis uterustan orijin alındığı kabul edilir ve sırasıyla en sık over, periton ve gastrointestinal sistemi tutar (5). Endometriozis genital ve ekstragenital olarak Santral Sinir Sistemi ve hatta göz tutulumu gibi pek çok farklı lokasyonda bulunabilmektedir (3). Endometrotik lezyonların abdominal ve pelvik sinir dokularına (sempatik, parasempatik, motor) basisini endometriozis semptomlarının ve ağrının temelini oluşturur.

ENDOMETRİOZİS VE DOKU İNVAZYONU

Doku invazyonunda en sık karşılaşılan endometriozis tipi derin infiltratif endometriozis (DIE) olarak kabul edilir. DIE, tanım olarak subperitoneal veya pelvik organ dokularına invazyon derinliği 5mm üzerindeki tutulumu gösteren endometriozis tipini ifade etmektedir. Pelvik endometriozisli kadınların %6' sini oluşturmaktadır (6), en sık semptomu ise ağrıdır (6). Ağrı, Endometrioziste künt,
