## KALP YETERSİZLİĞİNDE KULLANILAN DİĞER İLAÇLAR

Bahri KÖROĞLU<sup>1</sup>

### İVABRADİN

İvabradin ; stabil göğüs ağrısı ve kalp yetmezliğinin semptomatik tedavisinde kullanılan bir If inhibitördür. Kalp yetmezliğine bağlı semptomları olan ve kalp yetmezliğinin kötüleşmesi nedeniyle hastaneye yatma riskini azaltmak için EF %35 veya daha az ejeksiyon fraksiyonu olan hastalarda kullanım için onay almıştır. Kalp yetmezliği için Ivabradin kullanımına uygun hastalar, düşük ejeksiyon hacmi ve kalp hızı en az 70 bpm olan semptomatik kalp yetmezliği olan ve durumu beta blokerler tarafından tam olarak yönetilemeyen hastalardır.<sup>1,2</sup>

Ivabradin, kalp hızını düzenleyen, sinoatrial nod ta bulunan, pacemaker özelliği olan hücrelerde If kanalını bloke eder. Bu da kalp hızının azalmasına ve diyastolik sürenin uzamasına neden olur.<sup>3</sup> Dinlenme arında kalp hızının yüksek olması, sol ventrikül fonksiyonlarına zararlı etkilere ve diyastol süresinin kısalması nedeniyle kalbe kan akımının azalmasına yol açabilir. Kalp hızının yüksek olması kardiyovasküler hastalığı olan hastalarda olumsuz sonuçlarla ilişkilendirilmiştir. Bu nedenle, kardiyovasküler morbidite ve mortaliteyi azaltmak için istirahat kalp atış hızını azaltmak, ilaç üreticileri arasında terapötik bir hedeftir. Ivabradin kalp hızını azaltır ancak beta blokerler gibi miyokardiyal kasılma, gevşeme veya ventriküler repolarizasyonu etkilemez.

Ivabradin ağızdan alınan tabletler şeklinde kullanılır.

- Başlangıç dozu günde iki kez 5 mg olmalıdır.
- Doz, kalp atış hızına göre 2 hafta sonra ayarlanabilir.
