

Bölüm 15

TROIÐ KANSERLERİNDÉ TİROZİN KİNAZ İNHİBİTÖR TEDAVİSİ

Deniz IŞIK¹

GİRİŞ

Tiroid kanserleri endokrin sistemin en sık görülen malignitesi olmasına rağmen tüm kanserlerin ancak %1 den azını oluşturur(1). Yıllık insidansı 8/100.000 civarındadır(2) ve kadınlarda erkeklerden 3 kat daha fazla görülür(3). Tiroid kanserlerinin ana histolojik alt tipleri diferansiyel, medüller ve anaplastik kanserlerdir. Tiroid kanserlerinde başlıca tedavi yöntemleri cerrahi, radyoaktif iyot tedavisi, radyoterapi olmasına rağmen bu tedaviler altında progresyon ve metastaz gelişen vakalarda kemoterapi kullanılır. Konvansiyonel kemoterapötiklerin düşük etkinliği nedeni ile oral tirozin kinaz inhibitörleri (TKI) troid kanserlerinde kemoterapinin esas ögesi olarak öne çıkmaktadır.

DİFERANSİYE TROIÐ KANSERLERİ

Diferansiyel tiroid kanserleri (DTK) papiller, foliküler ve Hurthle hücrelli kanserleri içerir. Foliküler epitel hücrelerinden kaynaklanır ve normal tiroid dokusunun temel özelliklerine sahiptir. DTK nadir bir hastalık grubu olmasına rağmen dünya genelinde insidansı giderek artmaktadır(4). Klinikte saptanan troid kanserlerinin %60-80'ini mikropapiller tiroid kanseri oluşturur. Bu kanser türleri sodyum iyot simporter (NIS) ekspresyonu özelliğine sahiptir ve bu transmembran protein iyodun hücre içerisinde alınmasına görev alır. Cerrahi, radyoaktif iyot tedavisi ile hastalığın прогнозu genellikle çok iyidir. On yıllık sağkalım %85'lere ulaşmasına rağmen %30'lara varan oranlarda nüks edebildiği için yakın takip çok önemlidir (5,6,7).

Kinaz inhibitörleri

Birçok kanser türünde kinaz fonksiyonu tümör büyümeye, invazyon, metastaz ve apoptozdan kaçışta anahtar rol oynar. RET/PTC füzyon proto-onkogeni, RAS, BRAF ve VEGFR'ı hedefleyen küçük molekül inhibitörler DTK tedavisinde kli-

Mevcut tedavilerden başka deneysel TKI tedavileri devam etmekle beraber çoğu ilacın özellikle hastalık stabilizasyonu sağlamadaki etkinlikleri ön plana çıkmaktadır.

ANAPLASTİK TİROİD KANSERİ

Tüm kanser türleri arasında en agresif seyirli olanlardandır ve ortalama sağ kalım nadiren 12 ayı aşar(7). Diferansiyel tiroid kanserinin terminal dediferansasyonu ile geliştiği düşünülür. BRAF mutasyonunun patogenezdeki rolü belirlenmesine rağmen vaka sayılarındaki yetersizlik nedeniyle hedefe yönelik tedavilerden fayda sağlanamamıştır.

Imatinib : PDGFR, C-KIT ve BCR-ABL inhibisyonu sağlar. Anaplastik tümörlerde PDGFR aşırı ekspresyonu bildirilmiştir. 11 hastalık faz 2 çalışmada 2 hastada kısmi yanıt 4 hastada stabil yanıt alındı.

Sorafenib : küçük hasta gruplarında etkinlik değerlendirilmesi yapılmış ancak progresyonsuz sağ kalım bu çalışmalarda 4 ayı geçmemiştir.

Crotilibulin ve fosbretabulin gibi vasküler endotel hücrelerindeki tübüllerin destabilizasyonunu sağlayan ajanlar kemoterapi ile kombine denendi. Bunun haricinde BRAF , PI3K/mTOR ve MAPK sinyal yolaklarına yönelik deneysel ajanların çalışmaları devam etmektedir.

Bu derlemede tiroid kanserlerinin tedavisinde etkinlik göstermiş oral TKI' lara değindik. Tiroid kanserlerinin (anaplastik hariç) indolen seyri nedeni ile ve aynı zamanda kinaz inhibitörlerinin ciddi grade 3-4 yan etkileri ve hattaletal etki göstergemeleri sebebi ile tedavi başlama kararı alınırken iyi düşünülmeli ve mutlaka semptomatik , hızlı progrese hastalarda bu ajanlara başvurulmalıdır.
