

Bölüm 20

ENDOMETRİOZİS VE ÇEVRESEL FAKTÖRLER

Prof. Dr. Yakup KUMTEPE

Klinisyenler tarafından ayrıntılı bilgi sahibi olunmayan bu bölüm okuyucuya, hastalarına güncel yaşamdan öneriler sunmak açısından değerli bilgiler içermektedir. Diyetinde omega-3 yağ asidi tüketimi daha fazla olan kadınlarda endometriozis riski azalırken, trans-doymamış yağ tüketimi yüksek seviyedeki kadınlarda endometriozis görülmeye riskinin anlamlı derecede arttığı rapor edilmiştir. A vitamininin prekürsörü olan ve havuç, kayısı, biber gibi bitkilerde bol miktarda bulunan beta-karotenin ektopik endometrial dokunun büyümesi için gerekli olan anjiogenezi inhibe ettiği gösterilmiştir. Endometriozisli kadın fenotipinde kütanoz nevüslerin anlamlı şekilde daha sık görüldüğünü gösteren ve endometriozis ve cilt tümörleri ile ilişkili genlerin ortaklısına dair ipuçları sunan çalışmalar mevcuttur. Öte yandan aşırı alkol tüketiminin endometriozis semptomlarını alevlendirdiği ve hastlığın ilerlemesine katkıda bulunduğu öne sürülmüştür. Bölüm yeni bilimsel çalışmalara ışık tutacak bilgiler içermesi nedeniyle önem arz etmektedir. **Editorial**

Giriş

Postmenopozal kadınlarda da nadiren görülmesine rağmen endometriozis bir üreme dönemi hastalığıdır. Üreme dönemindeki kadınların %10unda endometriozis olduğunu varsayırsak tahmini bir ifade ile ülkemizde iki milyona yakın endometriozisli kadın olduğunu söyleyebiliriz. Endomet-

riozisli hastaların önemli bir kısmı asemptomatik olmasına rağmen hastalar hekime infertilite ve ağrı gibi iki önemli şikayetle başvururlar. Endometriozis oluşumunda 1921 deki Sampsonun retrograd menstrüasyon teorisinden sonra çölovik metaplazi teorisi gibi farklı teoriler ortaya atıldı. 1992 de Koninckx (1) endometriozisi peritoneal, ovarian ve rektovaginal septum endometriozis olarak 3 farklı kategoride topladı ve günümüzde özellikle klinisyenler arasında büyük kabul gördü. Son yıllarda endometriozis patogenezinde çalışmalar immunolojik faktörler üzerine yoğunlaşmıştır (2,3). Retrograd menstrüasyonla pelvik kaviteye ulaşan endometrial hücreler bir şekilde immün disfonksiyon olan bazı hastalarda temizlenemiyor ve abdominal kaviteye implant oluyor böylece hastalık gelişiyor (4). Oysa normal süreçte pelvik kaviteye dökülen endometrial hücreler bir antijen olarak kabul edilir ve lokal immün cevap oluşur. Makrofaj gibi bazı hücreler bu antijen olarak kabul edilen endometrial hücreleri T hücrelerine sunarlar. Bunun sonucunda ya sitotoksik T hücreler bir takım lethal substanslar salarak hedef hücreleri öldürür veya T helper hücreler sitokinler salgılayarak hücre ölümüne sebep olur.

İnsanlar günlük yaşamda, fizyolojik süreçler üzerinde istenmeyen etkiler yaparak hastalık oluşturma potansiyeline sahip pek çok doğal ve sentetik kimyasal maddeye maruz kalarak hastalıklara yakalanabilirler. Bu çevresel faktörler endometriozis oluşum mekanizmalarından birini etkileyerek
