LIFE KINETIC TRAINING AND APPLICATIONS IN FOOTBALL

Metin Can KALAYCI¹

Burak GÖNÜLTAŞ²

Abstract

The importance of training contents based on scientific bases that are well planned in terms of peak performance in football has been known for many years. In football, the development of the athletes' skills that require coordination as well as their technical and tactical characteristics are also important. In addition to muscle strength, maximum movement speed and neuromuscular activation are also important for optimum performance. Life Kinetic is one of the first training models to cover all the motor skills known so far. Along with the effects of life kinetic exercises on performance and the speed of skill learning, its contribution to the development of coordinative abilities has attracted attention by sports science researchers in recent years. In the researches, it is stated that Life Kinetics creates new structures in the central nervous system by speeding up the learning process of the athletes and
