GİRİŞ

Gelişimin başlangıcı dişi germ hücresi oosit ve erkek germ hücresi spermin birleşerek, yeni gelişecek canlıyı oluşturacak ilk hücre olan zigotun oluşumudur. Zigot anneye ve babaya ait genetik bilgiyi taşıyan, özelleşmiş totipotent özellikte, 46 kromozomlu ve 2n DNA'ya sahip somatik hücre karakterinde bir hücredir. Zigotun gelişimi embriyoner gelişim sürecinin başlangıcını oluşturur.

Embriyoner gelişimin ilk üç gününde sadece hücre proliferasyonu gerçekleşerek, mitozun gerçekleşmesi ile birlikte embriyoda hücre (blastomer) sayısı artacaktır. Gelişimin 4. gününden itibaren bu süreçte diferansiyasyon, kutuplaşma ve göç mekanizmaları da eklenir (Şekil 1). Embriyoner gelişim süreci boyunca hücrelerin proliferasyonu, diferansiyasyonu ve migrasyonu çeşitli indüksiyon mekanizmalarının kontrolünde gerçekleşerek yeni organizma oluşacaktır.

¹ Bursa Uludağ ÜTF Histoloji-Embriyoloji AD ve Kadın Hastalıkları ve Doğum AD ÜYTE Merkezi

bir şekilde düzenlenmiş, korunmuş mikroçevre içinde tutulmaları gerekmektedir. Kan-testis bariyeri seminifer epitel (germinal epithel) basal ve adluminal olmak üzere iki ayrı kompartimana ayıran ve maddelerin parasellüler geçişini kısıtlayan anatomik ve fonksiyonel bir engeldir. Sertoli hücreleri arasındaki sıkı bağlantı kompleksleri kan-testis bariyerini oluşturur (Şekil 20). Kan testis bariyeri ile ilgili ayrıntılı bilgi erkek genital sistemde anlatılmıştır.

Epididimal Matürasyon

Spermiyogenet tamamlandıktan sonra oluşan spermatozoonlar seminal sıvı ile birlikte seminifer tübul lümenine atılır. Seminifer tüblere üretilen spermler tubuli rekti, rete testis ve duktul efferentes'ten geçtikten sonra duktus epididymis'te depolanır.

Spermatogenez sürecinde sperm morfolojik olarak farklılaşmakta, fakat hareket kabiliyetini ve fertilizasyon kapasitesini elde edememektedir. Bu yeteneklerini kazanabilmesi için iki ekstra-testiküler olgunlaşma sürecini tamamlaması gereklidir. Bu süreçlerden biri erkek genital sistemde epididimiste gerçekleşir ve epididimal matürasyon olarak tanımlanır. Diğer ise dişi genital sisteme gerçekleşecektir ve kapasitasyon olarak tanımlanır. Bu değişim spermin farklı bölümlerde gerçekleşen biyokimyasal değişiklikler zinciridir.
