

KANSER AĞRISI YÖNETİMİNDE NÖROŞİRÜRJİKAL YÖNTEMLER

Yavuz SAMANCI¹

Selçuk PEKER²

ÖZET

Kanseri önleme ve tedavi etmeye yönelik kapsamlı çabalara rağmen, kanser her yıl yüzbinlerce insanı etkilemeye devam etmektedir. Ağrı, kanser hastaları arasında, özellikle ileri evre metastatik hastalarda, en sık görülen semptomlardan biridir. Kansere bağlı ağrı, genellikle şiddetli ve dirençli doğası, hastalık sürecini çevreleyen duygusal ve sosyal koşullar ve sıklıkla sınırlı yaşam bekłentisi dahil olmak üzere çeşitli nedenlerle hem hasta hem de klinisyen için zor bir dönemi temsil eder. Bu hastalarda fonksiyonel durumu ve genel yaşam kalitesini iyileştirmek için iyi bir ağrı kontrolü sağlamak çok önemlidir. Kanser hastalarının %10 veya daha fazlasının, genellikle doz sınırlayıcı yan etkilerden rahatsız oldukları için farmakolojik tedavi seçenekleriyle yeterli ağrı kontrolü yaşayamadıkları tahmin edilmektedir. Kanser ağrısının yönetimine yönelik multidisipliner bir yaklaşımda, nöroşirjikal yöntemler tedavinin önemli bir parçasıdır. Son yirmi yılda, kanser ağrısı mekanizmalarına ilişkin yeni edinilen bilgilerin yanı sıra mikrocerrahi, stereotaktik teknikler, bilgisayarlı tomografi ve manyetik rezonans görüntülemedeki gelişmelerin yardımıyla, nöroşirjikal girişimlerin daha kaliteli analjezi sağlama olasılığı yüksek olsa da ağrı yönetiminde kullanılan nöroşirjikal yöntemlerin rolü ilgili branş hekimleri tarafından hâlen yeterince bilinmemektedir. Uygun hastalarda nöroşirjikal yöntemlerin erken kullanılması, yalnızca etkili ağrı kontrolü değil aynı zamanda medikal tedavilere bağlı yan etkilerin azaltılması ve uzamış sağkalım avantajına da sahiptir. Sürdürülebilir ve etkili sonuçlar için doğru hastaya, uygun şekilde eğitilmiş bir nöroşirjijen tarafından, doğru zamanda ve doğru şekilde müdahale ilkelerine bağlı kalınmalıdır.
