# BİR DEVRİM: NİKEL TİTANYUM EĞELERİNİN GELİŞİMİ

**İpek ERASLAN AKYÜZ<sup>1</sup>**  
**Salih DÜZGÜN<sup>2</sup>**

## GİRİŞ

Nikel-titanyum (NiTi) alaşımları piyasaya sürüldüklerinden beri endodonti alanında devrim yaratmaya devam etmiştir. Endodontik tedavilerde paslanmaz çelik eğeler kullanılırken, kanalda basamak olması, perforasyon gelişmesi gibi dezavantajlar bulunmaktadır. Bu nedenle kanal anatomisine uyum sağlayan NiTi içeriğinde enstrümanlar geliştirilmiştir. Mekanik özellikler açısından geleneksel paslanmaz çelik eğelere göre önemli avantajlara sahiptir. Artan esneklik özellikleri ve kısa tedavi süresi avantajı dışında, NiTi eğeler ayrıca süperelastikyetleri sayesinde daha güvenli preparasyon imkanı doğmuştur (1). 1990'lı yılların başlarında ilk NiTi döner aletler kullanılmıştır (2).

## NİTİ EĞELERİN TARİHÇESİ

Ni-Ti alaşımı, 1963 yılında W.F. Buehler isimli bir metalurjistin Amerikada bir uzay programı için geliştirmesiyle kullanılmaya başlanmıştır. Çalışmanın yapıldığı 'Naval Ordnance Laboratory' isimli laboratuarın kısaltması yapılarak -Nitinol- adıyla tanıtılmıştır (3). Nikel titanyum alaşımları diş hekimliği alanında 1971 yılında Andreasen ve Hilleman tarafından ortodontik tel üretiminde kullanılmıştır. NiTi alaşımının ege üretimi amacıyla ilk kez 1975 yılında Civjan ile arkadaşları tarafından düşünülmüştür (4). Fakat asıl olarak NiTi aletler, 1988 yılında Walia ve arkadaşları tarafından geliştirilmiştir (5).

## NİTİ ALAŞIMLARININ İÇERİĞİ VE ÖZELLİKLERİ

Kullanılan NiTi alaşımları %56 nikel ve %44 titanyum içerir bu da neredeyse bire bir atomik oran (eş atomluluk) sağlar (6). NiTi alaşımalar, sıcaklık veya basınç

rijit ve taperı yüksek eğelerle apikal baskı uygulanmamalıdır. Pathfile ve Proglider gibi döner eğeler veya küçük boyuttaki el eğeleri ile giriş yolu oluşturulmalıdır. Dar ve eğimli kanallarda düşük tapera sahip eğeler kullanılabilir. Ayrıca egenin kırılmaya karşı direncini arttıran resiprokasyon hareketinin kullanıldığı gold ve blue wire gibi esnek ve şekeil hafızalı eğeler kullanılabilir.

## **SONUÇ**

İlk rejenerasyon eğeleri östenitik bir yapıya sahipken son rejenerasyon eğelerinin daha martensitik yapıda olduğunu söyleyebiliriz. Son nesil eğelerin kanal içinde merkezlenebilme yeteneği, kanal anatomisine sağladığı uyum ve şekillendirme etkinliği daha fazladır. Yapılan pek çok çalışma göstermektedir ki; martenzit yapıdaki NiTi alaşımaları, östenit alaşımalarından daha yumuşaktır ve şekil hafızası özelliğine sahiptir (67). Günümüzdeki eğelerin artan martenzit faz yapısı nedeniyle, döngüsel yorgunluğa karşı gelişmiş bir dirençle daha esnekir ve daha büyük bir dönme açısına sahiptir. Ancak bununla birlikte daha düşük torkla torsiyonel yorgunluğa bağlı kırılabilirler. Birden fazla döner ege sisteminin anlatıldığı bu derlemenin; endodonti alanına katkı sağlayacağını ve yapılacak araştırmalara referans oluşturabileceğini düşünmekteyiz.
