Kanser Hastalarında Hepatit B Tedavisi

Ayşe NURANSOY CENGİZ¹

GİRİŞ

Amerikan Kanser Topluluğu (ACS)'nun 2021 raporuna göre, 2021'de yaklaşık 1,9 milyon yeni kanser vakasının teşhis edileceği öngörmektedir. Yine, 600.000'den fazla kişinin kanserden öleceği tahmin edilmektedir (1). 1991 ila 2018 yılları arasında, kanserden ölüm oranı, 2017'den 2018'e %2,4'lük düşüş de dahil olmak üzere %31 düştüğü ortaya konmuştur (1). Bu 1 yıllık en büyük düşüş için yeni bir rekord olarak kabul edilmektedir. Ölümlerdeki düşüş, daha az insanın sigara içmesine, birçok kanser türünün daha erken teşhis edilmesine ve 1991'den 2018'e kadar 3,2 milyon daha az kanser ölümüne yol açan iyileştirilmiş tedavilere bağlanmaktadır (1). Kanserden ölüm oranları azalması immunsupresif hastaların artması sonucunu ortaya çıkarmaktadır. Bu durum, immunsupresif hastalarda görülen enfeksiyonların yaygınlığını artırmaktadır. Diğer yandan, enfeksiyonlar kanser hastalarında, altta yatan maligniteye ve çeşitli tedavi modalitelerine bağlı en sık görülen komplikasyonlar arasındadır (2).

Diger yandan, Hepatit B virusu (HBV) tüm dünyada yaygın olarak görülmektedir. Yakın zamanda yapılan çalışmalara göre dünya çapında 248 milyon insanın HBV ile enfekte olduğu tahmin edilmektedir (3). Onkolojik hastalarda HBV reaktivasyonuna (HBVR) bakıldığından, HBV'nin serolojik durumuna ve spesifik kemoterapi rejimine bağlı olarak %30 ila %80 arasında değişmektedir (4). HBVR'u asemptomatik olabileceği gibi ciddi hepatite, karaciğer yetmezliğine ve ölüme yol açabilmektedir. Genellikle antineoplastik kemoterapide gecikmelere yol açarak tümörle ilişkili mortalitede artışa neden olabilmektedir (5).
