Metastatik Prostat Kanserinde Moleküler Hedefli Tedaviler

Harun MUĞLU ¹

GİRİŞ

Metastatik prostat kanserinin tedavi yelpazesi son iki dekatta önemli ölçüde gelişti. Birkaç dönüm noktası niteliğindeki faz 3 denemeler, yeni geliştirilen ilaçlar ile tedavi seçeneklerinde hızlı değişikliklere yol açtı. Bu ilaçlar, farklı etki mekanizmalarına (hormonal, kemoterapi, radyonüklid, immünoterapi ve hedefe yönelik terapiler gibi) sahip ilaçları içerir(1).

Hastalığın ileri evrelerinde (metastatik kastrasyona dirençli prostat kanseri) geliştirilen tedaviler, daha erken evrelerine (metastatik hormon naif prostat kanseri) doğru kaymaya başlamıştır. Biyomarker tabanlı hassas tip yaklaşımları, hastaların bireysel özelliklerine göre en etkili tedavileri seçmeyi amaçlamaktadır(2).

Biyomarker tabanlı hassas tip yaklaşımları, metastatik prostat kanserinin tedavisinde önemli bir umut vadetmektedir. Bu yaklaşımların geliştirilmesi için daha fazla araştırmaya ihtiyaç vardır (3, 4).

METASTATİK KASTRASYON DUYARLI PROSTAT KANSERİNDE HEDEFLİ TEDAVİLER

Metastatik hormon duyarlı prostat kanseri (mHSPC), prostat kanserinin vücudun diğer bölgelerine yayıldığı, ancak hormon tedavisine hala yanıt verdiği bir tür prostat kanseridir. mHSPC, prostat kanserinin en yaygın görülen türüdür. Prostat kanseri teşhisini konan erkeklerin yaklaşık %30'u mHSPC ile teşhis edilir (5).

ilerlemelerle birlikte, biyobelirteçleri daha iyi geliştirmek, hasta içi ve hastalararası heterojenliği yenmek ve ortaya çıkan direnç mekanizmalarıyla mücadele etmek için bir dizi yeni fırsat ve karşılanmamış ihtiyaçlar ortaya çıkması sonucunda ileri çalışmaların yapılması gerekliliğini ortaya koydu.
