MALİGN PLEVRAL MEZOTELYOMADA RADYOTERAPİ

Hale Başak ÇAĞLAR¹

OLGU

İlk olarak Nisan 2018'de nefes darlığı şikayeti başlayan hastaya yapılan tetkiklerde sol hemitoraksta plevral kalınlaşma tespit edilmiştir. Hastanın Temmuz 2018 pozitron emisyon tomografisinde (PET-BT) plevrade malign FDG uptake izlenmiştir. Hastaya radikal plevrektomi uygulanmış, aynı seansta hipertermik kemoterapi yapılmıştır. Hastanın postoperatif patoloji sonucu epiteloid mezotelyoma olarak gelmiştir. Bunun üzerine hastaya 6 kür sisplatin ve pemetreksed ve 2 kür idame pemetreksed uygulanmıştır. Hastanın kontrol PET-BT'sinde sol hemitoraksta birkaç alanda şüpheli uptake mevcuttur ve eskisine göre belirginleşmiştir. Bunun üzerine hastaya ipsilateral hemitorasik radyoterapi (RT) endikasyonu konulmuştur. Hastaya 54 Gy RT uygulanmıştır. Simultane integre boost tekniği ile nüks bölgesinde doz artımı sağlanmıştır (Resim 1). 7/2019'dan sonra alt solunum yolu enfeksiyonu nedeniyle tedavi olan hastanın genel durum daha ortadır. Hastanın 2 ay sonra çekilen kontrol PET-BT'sinde (9/2019) yaygın radyasyon pnömonitisi gelişmiştir. Bunun üzerine hastaya radyasyon pnömonitisi tanısıyla tedavi başlanmış ve tedavi ile semptomatik rahatlaması olmuştur. Hastanın kontrol takiplerinde akut konsolidasyon azalmış, fibrozis gelişmiş ve tümör progresyonu saptanmamıştır. Hastanın 2 yıllık takiplerinde yeni gelişen bir lezyon izlenmemiştir.
