İTERSTİSYEL AKCİĞER HASTALIKLARININ TANISINDA İNVAZİV TANI YÖNTEMLERİ

İsmail Can KARACAOĞLU¹

İnterstisyel akciğer hastalıkları (İAH) olarak adlandırılan diffüz parankimal akciğer hastalıkları (DPAH); benzer seyreden klinik, radyolojik, fizyolojik veya patolojik belirtiler nedeniyle aynı çatı altında sınıflandırılan geniş heterojen bir hastalık grubudur (Şekil-1¹). Bu bölümde interstisyel akciğer hastalığını değerlendirmek için doku biyopsisi endikasyonları ve biyopsiyi elde etme yöntemleri gözden geçirilecektir.

¹ Uzm. Dr., İsmail Can Karacaoğlu, SBÜ Van Eğitim ve Araştırma hastanesi, Göğüs Cerrahisi Kliniği, cankaracaoğlu@gmail.com

me nedeniyle, mortalitelerdeki farklılığa muhtemelen bir ölçüde katkıda bulunmuştur. Üçüncüsü, bağışıklığı baskılanmış solunum yetmezliği olan en yüksek ölüm oranına sahip hasta grubuna, VATS yerine torakotomi uygulanması, ölüm ve komplikasyon oranlarını VATS lehine daha da çarpıtmıştır.

Sonuç olarak “hastalık yoktur hasta vardır” mottosu ile en iyi cerrahi seçeneğin, deneyimli cerrah ve anestezi ekibinin birlikte vereceği kararla belirlenmesi uygun olacaktır.
