

BÖLÜM 33

COVID-19'DA ORGAN SPESİFİK TUTULUMLAR, KOMPLİKASYONLAR VE PROGNOSTİK FAKTÖRLER

Ahmed BİLAL GENÇ¹
Selçuk YAYLACI²

GİRİŞ

COVID-19 (SARS-CoV-2) ön planda damlacık yoluyla bulaşan bir viral enfeksiyon olarak gözükse de tüm organ sistemlerini etkileyebilecek düzeyde komplikasyonlara neden olmaktadır. Literatürde pulmoner, extrapulmoner (kardiyovasküler, nörolojik, hematolojik vs) bir çok komplikasyon bildirilmektedir.

Gerek yaş, cinsiyet, kronik hastalıklar gibi demografik veriler gerekse de birçok laboratuar parametresi hastalığın prognostik faktörleri olarak kullanılmaya başlanmıştır. Yaş, erkek cinsiyet, sigara içimi, eşlik eden komorbid hastalıklar, C-Reaktif protein (CRP), prokalsitonin, nötrofil yüksekliği, albumin, trombosit ve lenfosit düşüklüğü bildirilen kötü sonlanım faktörlerinden bağılılardır.

Bu bölümde COVID-19 hastalarında oluşabilecek organ spesifik tutulumları, komplikasyonları

ve prognostik faktörleri literatür eşliğinde incelenmesi amaçlanmıştır.

COVID-19'DA organ spesifik tutulumlar ve komplikasyonlar

Pulmoner tutulum ve komplikasyonlar

SARS-CoV-2 enfeksiyonu ile ilişkili akciğer tutulumunun şiddeti, hafif pnömoniden (%81), şiddetli hastalıkla ilişkili hipoksiye (%14), kritik hastalıkla birlikte şok, solunum yetmezliği ve çoklu organ yetmezliğine (%5) ve ölüme (%2.3) kadar ilerleyebilir[1,2]. Bilinen akciğer hastalığı olan bireylerde COVID-19 mortalitesi de daha yüksek olduğu vurgulanmaktadır[3].

Hastanede yatan hastaların bir bölümünde akut solunum sıkıntısı sendromu (ARDS) gelişebilmektedir[4]. Toplam 663 hastanın dâhil edildiği ve total mortalitenin %31 (203 hasta) olduğu bir çalışmada, ARDS, mortal seyreden
